# MagicBook Technologies – Seed Report for Mirofish

Purpose: factual seed document for multi-agent simulation of feature strategy and market reaction in Brazil, Portugal and the USA. Items marked **[FILL]** are unknowns to complete before upload. Items marked **[ASSUMPTION]** are unverified.

## 1. Company snapshot

- MagicBook Technologies builds AI-powered notebooks and apps that connect handwriting to AI. Tagline: "The Cognitive Interface Between Handwriting and Artificial Intelligence."
- Positioning: education first, with stated ambitions in enterprise and creative work. The long-term vision is a universal cognitive interface across education, science, medicine, engineering and creative industries.
- Founders: Helder Silva (Founder & Head of Product, PhD in Neuroscience, Portuguese entrepreneur awards) and Adriana Oliveira (Founder & Head of Growth for Latin America). The company's legal and privacy pages are in Portuguese, which suggests a Portugal/Brazil base.
- Distribution: integrated with paper manufacturers. A MagicBook code is printed on each notebook page; scanning it links the paper notes to the app.
- Users: **about 25,000 (internal figure, Oct 2026)**. Note: the public website claims "100,000+ users worldwide". Reconcile before simulation and decide which figure to treat as true.
- Feedback to date: positive only. No negative feedback has been recorded. **[FILL]** any ratings, NPS, reviews, support themes or churn data.

## 2. Product portfolio

The website lists these products: MagicBook, Jandia, Wise Book, Estudia, Plania and Dino. MagicBoard is not listed publicly. **[FILL]** what MagicBoard is, and what Jandia, Wise Book, Estudia and Plania each are and who they target.

### MagicBook (core)

1. Scan: photograph handwritten or printed notes; the page is detected automatically.
2. Review and extract: OCR converts notes into editable text for correction.

3. Apply intelligence: summarize, translate, solve equations, generate quizzes, create flashcards, rephrase, shorten, chat with notes.

Other stated capabilities:

- Automatic organization into structured tabs, plus a searchable knowledge archive that grows over time.
- AI assistant that answers questions aligned to the school curriculum with verified sources (a "personalized tutor").
- Voice recording of classes, transcription to notes, and text-to-speech playback.

### Dino

Turns children's drawings into animated, educational stories (science, history, values, creativity). Flow: draw on paper, scan with phone, AI animates, personalized educational story.

## 3. Current strengths (from available evidence)

- Paper-to-digital bridge via printed page codes, which creates a hardware-light distribution model through notebook partners.
- Broad AI feature set built on one OCR/knowledge core.
- Curriculum alignment claim and multimodal learning (written, spoken, interactive).
- Strong founder credentials; Portuguese-language roots.

## 4. Known gaps and risks to test

- Feature breadth may dilute focus: many AI tools (summarize, translate, chat, quiz, flashcards, voice) overlap with free general-purpose AI apps.
- Dependence on notebook partners for acquisition and printed codes.
- Handwriting OCR accuracy across languages, scripts and messy children's handwriting. **[FILL]** accuracy figures.
- Child data privacy and consent: LGPD (Brazil), GDPR (Portugal/EU), COPPA and FERPA (USA).
- Curriculum alignment depth per country is unverified. **[FILL]** which curricula are actually supported.
- No public pricing, business model or USA presence found on the website. **[FILL]**

## 5. Market context to simulate

| Market | Language | Curriculum / standard | Presence today | Key questions |
|---|---|---|---|---|
| Brazil | pt-BR | BNCC **[FILL]** | **[FILL]** | Parent and school buying behavior, price sensitivity, LGPD |
| Portugal | pt-PT | National curriculum **[FILL]** | **[FILL]** | Differences from pt-BR, EU AI and data rules, school adoption |
| USA | English (plus Spanish) | State standards / Common Core **[FILL]** | None found **[ASSUMPTION]** | Competition from Google, Photomath, Khanmigo; COPPA; channel to notebook brands |

**[FILL]** per market: notebook brand partners, user counts, pricing, competitors observed.

## 6. Business data needed for quantitative analysis

**[FILL]** all of the following:

- Users, MAU and retention by country and by product.
- Feature usage ranking (which features are used most and least).
- Conversion and pricing; who pays (parent, school or notebook brand).
- Acquisition cost and channel mix.
- Content generation cost per user (AI/API cost).

## 7. Prediction questions for Mirofish

1. How do students, parents and teachers in Brazil, Portugal and the USA react to MagicBook and Dino?
2. Which existing features would users barely miss if removed, and which are core?
3. Which new features would increase adoption and retention in each market?
4. How should the product be positioned and showcased in each market (school channel, notebook brand, direct to parents)?
5. What objections, regulatory concerns and competitor responses emerge, especially in the USA?

6. Which market should be prioritized first, and why?

## 8. Caveat

Simulation output is qualitative scenario modeling from LLM agents, not a statistical forecast. Validate conclusions with real data such as pilots, surveys and usage analytics before major decisions.
